

ABSTRACT

An automatic call connection method for a mobile communication terminal is disclosed. The method comprises storing call information used during
5 initial call setup; determining whether unintentional call drop has occurred if an
air message is not received for a previously set valid waiting time during a call
using the call information; and generating, if it is determined that unintentional
call drop has occurred, a message for providing notification of the unintentional
call drop by a party that recognized the unintentional call drop, transmitting the
10 generated message to the other party, and automatically connecting a previous
call based on the stored call information.
